

CMOS Programmable Low Power Single Operational Amplifier

- Offset null capability (by external compensation)
- Dynamic characteristics adjustable I_{SET}
- Consumption current and dynamic parameters are stable regarding the voltage power supply variations
- Output voltage can swing to ground
- Very large I_{SET} range
- Stable and low offset voltage
- Three input offset voltage selections

Description

The TS271 is a low cost, low power single operational amplifier designed to operate with single or dual supplies. This operational amplifier uses the ST silicon gate CMOS process giving it an excellent consumption-speed ratio. This amplifier is ideally suited for low consumption applications.

The power supply is externally programmable with a resistor connected between pins 8 and 4. It allows to choose the best consumption-speed ratio and supply current can be minimized according to the required speed. This device is specified for the following I_{SET} current values: 1.5 μ A, 25 μ A, 130 μ A.

This CMOS amplifier offers very high input impedance and extremely low input currents. The major advantage versus JFET devices is the very low input currents drift with temperature see [Figure 8](#), [Figure 19](#), [Figure 30](#).
