DESCRIPTION

The M74HC273 is an high speed CMOS OCTAL D TYPE FLIP FLOP WITH CLEAR fabricated with silicon gate C²MOS technology. Information signals applied to D inputs are transferred to the Q outputs on the positive-going edge of the clock pulse.

When the $\overline{\text{CLEAR}}$ input is held low, the Q output are in the low logic level independent of the other inputs. All inputs are equipped with protection circuits against static discharge and transient excess voltage.

C_{PD}	Power Dissipation Capacitance (note 1)	5.0			43						pF

1) C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. $I_{CC(opr)} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}/8$ (per FLIP FLOP), and the total CPD when n pcs of FLIP FLOP operate can be gained by the following equations: $CPD(\text{total}) = 32 + 11 \times n$
