## Product Description

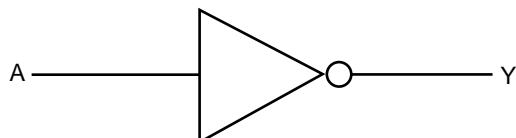

Pericom Semiconductor's PI74LVC series of logic circuits are produced using the Company's advanced 0.5 micron CMOS technology, achieving high speed while maintaining low power operation.

The PI74LVC04A Hex Inverter contains six independent inverters that perform the Boolean function Y =  $\bar{A}$ .

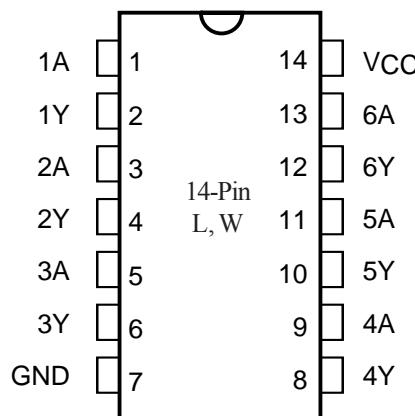

Inputs can be driven from either 3.3V or 5.0V devices allowing the PI74LVC04A to be used as a translator in a mixed 3.3V/5.0V system.

## Notes:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

1. The Input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.
  2. The value of  $V_{CC}$  is provided in the recommended operating conditions table.
  3. The package thermal impedance is calculated in accordance with JESD 51.
