

12-Bit To 24-Bit Multiplexed D-Type Latch with 3-State Outputs

Product Features

- Designed for low voltage operation, V_{CC} from 1.65V to 3.6V
- Sub 2.0ns delays at 2.5V and 3.3V
- Dynamic Impedance Control on outputs, current drive $> \pm 24\text{mA}$ at 2.5V V_{CC}
- Patented noise reduction circuit
- I/O Tolerant to 3.6V, Inputs and Outputs for mixed voltage systems
- Supports live insertion
- Industrial operation at -40°C to $+85^{\circ}\text{C}$
- Available Packages:
 - 48-pin 240 mil wide plastic TSSOP (A48)
 - 48-pin 173 mil wide plastic TVSOP (K48)

Product Description

Pericom Semiconductor's PI74AVC series of logic circuits are produced using the Company's advanced 0.35 micron CMOS technology, achieving industry leading speed.

The 12-bit to 24-bit multiplexed D-type latch is used in applications where two separate datapaths must be multiplexed onto, or demultiplexed from, a single data path.

Typical applications include multiplexing and/or demultiplexing address and data information in microprocessor or bus-interface applications. This device is also useful in memory-interleaving applications.

Three 12-bit I/O ports (A1-A12, 1B1-1B12, and 2B1-2B12) are available for address and/or data transfer. The output-enable ($\overline{\text{OE1B}}$, $\overline{\text{OE2B}}$, and $\overline{\text{OEA}}$) inputs control the bus transceiver functions. The $\overline{\text{OE1B}}$ and $\overline{\text{OE2B}}$ control signals also allow bank control in the A-to-B direction.

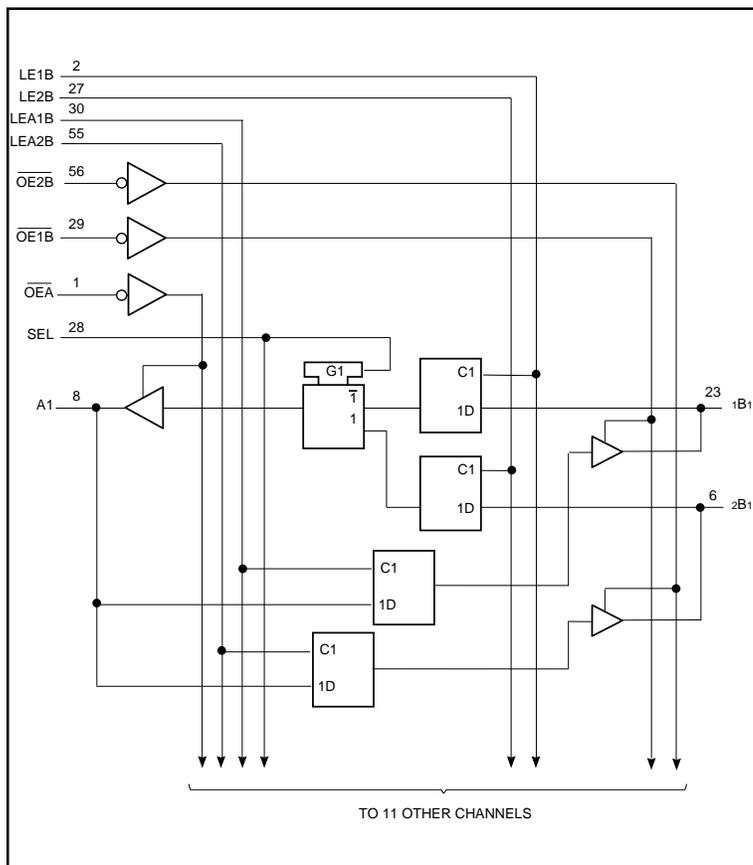

Address and/or data information can be stored using the internal storage latches. The latch-enable (LE1B, LE2B, LEA1B, and LEA2B) inputs are used to control data storage. When the latch-enable input is HIGH, the latch is transparent. When the latch-enable input goes LOW, the data present at the inputs is latched and remains latched until the latch-enable input is returned HIGH.

To ensure the high-impedance state during power up or power down, $\overline{\text{OE}}$ should be tied to V_{CC} through a pullup resistor, the minimum value of the resistor is determined by the current-sinking capability of the driver.

Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

The PI74AVCH16260 has "Bus Hold" which retains the data input's last state whenever the data input goes to high-impedance preventing "floating" inputs and eliminating the need for pullup/down resistors.

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature	-65°C to +150°C
Ambient Temperature with Power Applied	-40°C to +85°C
Input Voltage Range, V_{IN}	-0.5V to $V_{CC} + 0.5V$
Output Voltage Range, V_{OUT}	-0.5V to $V_{CC} + 0.5V$
DC Input Voltage	-0.5V to +5.0V
DC Output Current	100 mA
Power Dissipation	1.0W

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
