## Radiation-Hardened Octal Transparent Latches with Three-State Outputs

### FEATURES

- 8 latches in a single package
- Three-state bus-driving true outputs
- Full parallel access for loading
- $1.2\mu$  radiation-hardened CMOS
  - Latchup immune
- High speed
- Low power consumption
- Single 5 volt supply
- Available QML Q or V processes
- Flexible package
  - 20-pin DIP
  - 20-lead flatpack

### DESCRIPTION

The UT54ACS373 and the UT54ACTS373 are 8-bit latches with three-state outputs designed for driving highly capacitive or relatively low-impedance loads. The device is suitable for buffer registers, I/O ports, and bidirectional bus drivers.

The eight latches are transparent D latches. While the enable (C) is high the Q outputs will follow the data (D) inputs. When the enable is taken low, the Q outputs will be latched at the levels that were set up at the D inputs.

An output-control input ( $\overline{OC}$ ) places the eight outputs in either a normal logic state (high or low logic levels) or a high-impedance state. The high-impedance third state and increased drive provide the capability to drive the bus line in a bus-organized system without need for interface or pull-up components.

The output control  $\overline{OC}$  does not affect the internal operations of the latches. Old data can be retained or new data can be entered while the outputs are off.

The devices are characterized over full military temperature range of  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

### FUNCTION TABLE

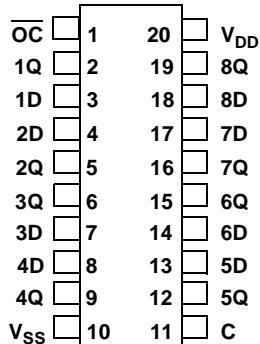

INPUTS			OUTPUT

**Note:**

1. Stresses outside the listed absolute maximum ratings may cause permanent damage to the device. This is a stress rating only, functional operation of the device at these or any other conditions beyond limits indicated in the operational sections is not recommended. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### Notes:

1. Functional tests are conducted in accordance with MIL-STD-883 with the following input test conditions:  $V_{IH} = V_{IH}(\text{min}) + 20\%$ ,  $-0\%$ ;  $V_{IL} = V_{IL}(\text{max}) + 0\%$ ,  $-50\%$ , as specified herein, for TTL, CMOS, or Schmitt compatible inputs. Devices may be tested using any input voltage within the above specified range, but are guaranteed to  $V_{IH}(\text{min})$  and  $V_{IL}(\text{max})$ .
2. Supplied as a design limit but not guaranteed or tested.
3. Per MIL-PRF-38535, for current density  $\leq 5.0E5$  amps/cm<sup>2</sup>, the maximum product of load capacitance (per output buffer) times frequency should not exceed 3,765 pF/MHz.
4. Not more than one output may be shorted at a time for maximum duration of one second.
5. Capacitance measured for initial qualification and when design changes may affect the value. Capacitance is measured between the designated terminal and  $V_{SS}$  at frequency of 1MHz and a signal amplitude of 50mV rms maximum.
6. Maximum allowable relative shift equals 50mV.
7. All specifications valid for radiation dose  $\leq 1E6$  rads(Si).
8. Power does not include power contribution of any TTL output sink current.
9. Power dissipation specified per switching output.
10. This value is guaranteed based on characterization data, but not tested.
