9-Bit D-Type Flip-Flop

Description

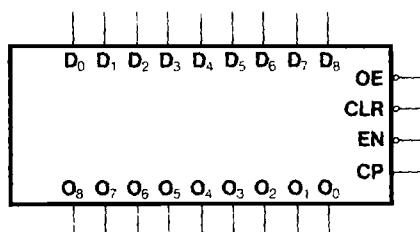

The 'AC/'ACT823 and 'AC/'ACT824 are 9-bit buffered registers. They feature Clock Enable and Clear which are ideal for parity bus interfacing in high performance microprogramming systems. The 'AC/'ACT 823 offers noninverting outputs and the 'AC/'ACT824 offers inverting outputs.

The 'AC/'ACT823 is fully compatible with AMD's AM29823.

- Outputs Source/Sink 24 mA
- 3-State Outputs for Bus Interfacing
- Inputs and Outputs are on Opposite Sides
- 'ACT823 and 'ACT824 have TTL-Compatible Inputs

Ordering Code: See Section 6

Logic Symbol ('AC/'ACT823)*

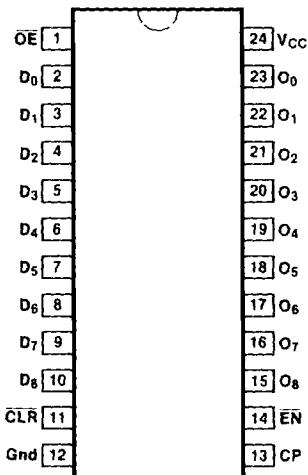

*The 'AC/'ACT824 has inverting outputs.

Functional Description

The 'AC/'ACT823 and 'AC/'ACT824 consist of nine D-type edge-triggered flip-flops. These have 3-state outputs for bus systems organized with inputs and outputs on opposite sides. The buffered clock (CP) and buffered Output Enable (\overline{OE}) are common to all flip-flops. The flip-flops will store the state of their individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH CP transition. With \overline{OE} LOW, the contents of the flip-flops are available at the outputs. When \overline{OE} is HIGH, the outputs go to the high impedance state. Operation of the \overline{OE} input does not affect

the state of the flip-flops. In addition to the Clock and Output Enable pins, there are Clear (\overline{CLR}) and Clock Enable (\overline{EN}) pins. These devices are ideal for parity bus interfacing in high performance systems.

When \overline{CLR} is LOW and \overline{OE} is LOW, the outputs are LOW. When \overline{CLR} is HIGH, data can be entered into the flip-flops. When \overline{EN} is LOW, data on the inputs is transferred to the outputs on the LOW-to-HIGH clock transition. When the \overline{EN} is HIGH, the outputs do not change state, regardless of the data or clock input transitions.

Function Table

Inputs					Internal	Outputs		Function
\overline{OE}	\overline{CLR}	\overline{EN}	CP	D		\overline{O} ('823)	\overline{O} ('824)
