DESCRIPTION:

The FCT543T is a non-inverting octal transceiver built using an advanced dual metal CMOS technology. This device contains two sets of eight D-type latches with separate input and output controls for each set. For data flow from A to B, for example, the A-to-B Enable ($\overline{\text{CEAB}}$) input must be low in order to enter data from A_0 - A_7 or to take data from B_0 - B_7 , as indicated in the Function Table. With $\overline{\text{CEAB}}$ low, a low signal on the A-to-B Latch Enable ($\overline{\text{LEAB}}$) input makes the A-to-B latches transparent; a subsequent low-to-high transition of the $\overline{\text{LEAB}}$ signal puts the A latches in the storage mode and their outputs no longer change with the A inputs. With $\overline{\text{CEAB}}$ and $\overline{\text{OEAB}}$ both low, the 3-state B output buffers are active and reflect the data present at the output of the A latches. Control of data from B to A is similar, but uses the $\overline{\text{CEBA}}$, $\overline{\text{LEBA}}$ and $\overline{\text{OEBA}}$ inputs.
