## DESCRIPTION

The 74AC/ACT11241 high-performance CMOS devices combine very high speed and high output drive comparable to the most advanced TTL families.

The 74AC/ACT11241 device is an octal buffer that is ideal for driving bus lines or buffer memory address registers. The device features two Output Enables ( $1OE$  and  $2OE$ ), each controlling four of the 3-State outputs.

## Note:

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu W$ ):

$$P_D = C_{PD} \times V_{CC}^2 \times f_I + \sum (C_L \times V_{CC}^2 \times f_O)$$

where:  
 $f_I$  = input frequency in MHz,  $C_L$  = output load capacitance in pF,

$f_O$  = output frequency in MHz,  $V_{CC}$  = supply voltage in V,

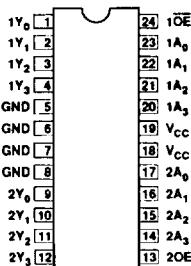

$\sum (C_L \times V_{CC}^2 \times f_O)$  = sum of outputs

## NOTES:

1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

## NOTES:

- Not more than one output should be tested at a time, and the duration of the test should not exceed 10ms.
- This is the increase in supply current for each input that is at one of the specified TTL voltage levels rather than 0V or  $V_{CC}$ .
