Am25LS158 • Am54LS/74LS158

Quadruple 2-Line To 1-Line Data Selectors/Multiplexers

DISTINCTIVE CHARACTERISTICS

- Selects four of eight data inputs with single select line and overriding strobe
- Inverting 'LS158 and Non-inverting 'LS157 configurations
- Standard TTL outputs
- Am25LS devices offer the following improvements over Am54/74LS
 - Higher speed
 - 50mV lower V_{OL}
 - Twice the fan-out over military range
 - 440 μ A source current at HIGH output
- 100% product assurance screening to MIL-STD-883 requirements

FUNCTIONAL DESCRIPTION

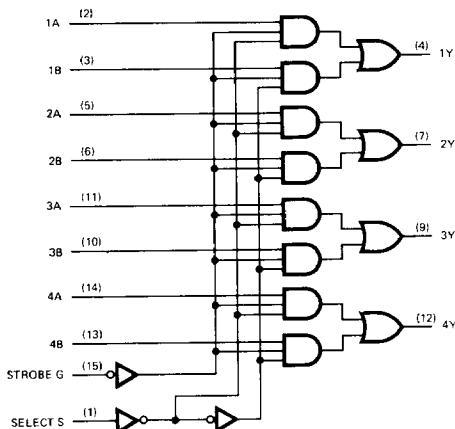

These data selectors/multiplexers are used to select a 4-bit word from one of two sources. The four outputs at the Am25LS157 present true data with respect to the input data. The four outputs of the Am25LS158 present inverted data with respect to the inputs and also minimize propagation delay. A common active-HIGH strobe (active-LOW enable) is provided on all devices.

A single select line, S, is used to select one of the two multiplexer input words. When the select is LOW, the A input word is present at the output. When the select is HIGH, the B input word is present at the output.

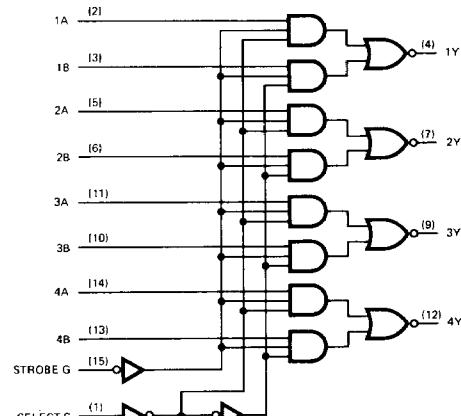

The Am54LS/74LS157 and 158 are standard performance versions of the Am25LS157 and 158. See appropriate electrical characteristic tables for detailed Am25LS improvements.

* AC performance over the operating temperature range is guaranteed by testing defined in Group A, Subgroup 9.

DEFINITION OF FUNCTIONAL TERMS

1A, 2A, 3A, 4A The data inputs for the 4-bits of the A word.

1B, 2B, 3B, 4B The data inputs for the 4-bits of the B word.

1Y, 2Y, 3Y, 4Y The four outputs of the multiplexer. The input data is inverted at the output on the Am25LS158 and non-inverted at the output for the Am25LS157.

G Strobe. When the strobe is HIGH, the four outputs of the Am25LS157 are LOW and the outputs of the Am25LS158 are HIGH. When the strobe is LOW, the devices are enabled to pass data.

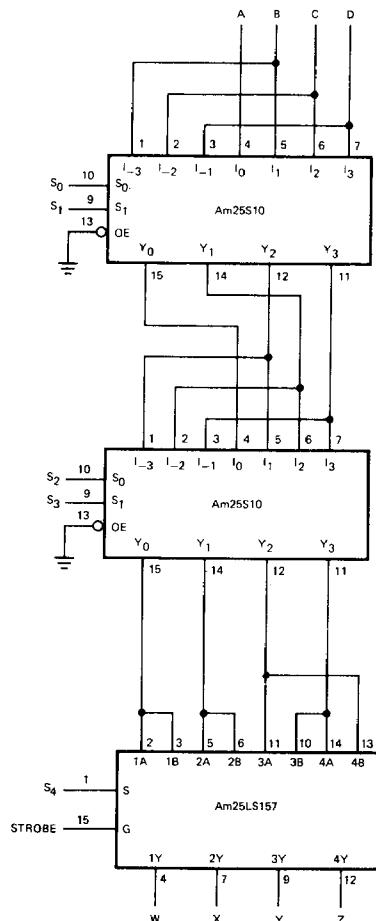

S Select. When the select input is LOW, the A word is present at the output. When the select input is HIGH, the B word is present at the output.

Two Am25S10 four-bit shifters are used in conjunction with an Am25LS157 multiplexer to perform all possible permutations on four inputs. The number of combinations possible on n items is given as $n!$. Thus, for n equal to 4, 24 combinations are possible. The Function Table shows all 32 combinations of the 5-bit select code including the 8 redundant states. This connection can be particularly useful in security systems and certain random number generation schemes. The eight redundant states can be placed at other select field locations through proper design.
