## Octal TRI-STATE® Bus Driver

### General Description

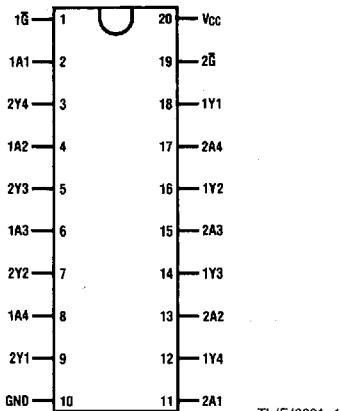

These octal TRI-STATE bus drivers are designed to provide the designer with flexibility in implementing a bus interface with memory, microprocessor, or communication systems, and are low power dissipation versions of the 'ALS240 and 'ALS241. The output TRI-STATE gating control is organized into two separate groups of four buffers. The 'ALS1240 control inputs symmetrically enable the respective outputs when set logic low. The TRI-STATE circuitry contains a feature that maintains the buffer outputs in TRI-STATE (high impedance state) during power supply ramp-up or ramp-down. This eliminates bus glitching problems that arise during power-up and power-down.

### Features

- Advanced oxide-isolated, ion-implanted Schottky TTL process
- Switching response specified into 500Ω and 50 pF load
- Switching response specifications guaranteed over full temperature and V<sub>CC</sub> supply range
- PNP input design reduces input loading
- Low power dissipation version of the DM54/74ALS240, 241
- Low level drive current: 74ALS = 16 mA

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
