

## OCTAL BUS TRANSCEIVERS

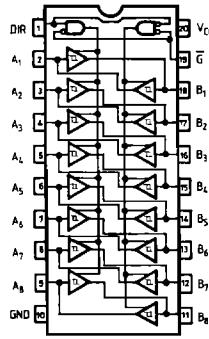

### DESCRIPTION

The T74LS645 is an octal bus transceiver designed for asynchronous two-way communication between data buses. Control function implementation reduces to a minimum external timing requirements. This circuit permits transmission of data from the A bus to B or from the B bus to A bus depending upon the logic level of the direction control (DIR) input. The device can be disabled by the Enable input (G) causing the buses to be effectively isolated.

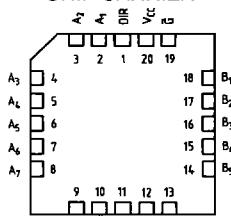

### PIN CONNECTION (top view)

### TRUTH TABLE

CONTROL INPUTS		OPERATION
G	DIR	
L	L	B Data to A Bus
L	H	A Data to B Bus
H	X	Isolation

L = LOW Voltage Level

H = HIGH Voltage Level

X = Don't Care

## ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V <sub>CC</sub>	Supply Voltage	- 0.5 to 7	V
V <sub>I</sub>	Input Voltage, Applied to Input	- 0.5 to 15	V
V <sub>O</sub>	Output Voltage, Applied to Output	- 0.5 to 10	V
I <sub>I</sub>	Input Current, into Inputs	- 30 to 5	mA
I <sub>O</sub>	Output Current, into Outputs	50	mA

Stresses in excess of those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions in excess of those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
