## QUADRUPLE 2-LINE TO 1-LINE DATA SELECTOR/MULTIPLEXER

SCES257C – APRIL 1999 – REVISED FEBRUARY 2000

- **EPIC™ (Enhanced-Performance Implanted CMOS) Submicron Process**
- **DOC™ (Dynamic Output Control) Circuit Dynamically Changes Output Impedance, Resulting in Noise Reduction Without Speed Degradation**
- **Dynamic Drive Capability Is Equivalent to Standard Outputs With  $I_{OH}$  and  $I_{OL}$  of  $\pm 24$  mA at 2.5-V  $V_{CC}$**
- **Oversvoltage-Tolerant Inputs/Outputs Allow Mixed-Voltage-Mode Data Communications**
- **$I_{off}$  Supports Partial-Power-Down Mode Operation**
- **Package Options Include Plastic Small-Outline (D), Thin Very Small-Outline (DGV), and Thin Shrink Small-Outline (PW) Packages**

### description

A Dynamic Output Control (DOC) circuit is implemented, which, during the transition, initially lowers the output impedance to effectively drive the load and, subsequently, raises the impedance to reduce noise. Figure 1 shows typical  $V_{OL}$  vs  $I_{OL}$  and  $V_{OH}$  vs  $I_{OH}$  curves to illustrate the output impedance and drive capability of the circuit. At the beginning of the signal transition, the DOC circuit provides a maximum dynamic drive that is equivalent to a high-drive standard-output device. For more information, refer to the TI application reports, *AVC Logic Family Technology and Applications*, literature number SCEA006, and *Dynamic Output Control (DOC™) Circuitry Technology and Applications*, literature number SCEA009.

**Figure 1. Output Voltage vs Output Current**

This quadruple 2-line to 1-line data selector/multiplexer is operational at 1.2-V to 3.6-V  $V_{CC}$ , but is designed specifically for 1.65-V to 3.6-V  $V_{CC}$  operation.

The SN74AVC157 features a common strobe ( $\bar{G}$ ) input. When the strobe is high, all outputs are low. When the strobe is low, a 4-bit word is selected from one of two sources and is routed to the four outputs. The device provides true data.

This device is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

The SN74AVC157 is characterized for operation from  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ .
