description

This hex Schmitt-trigger inverter is designed for 2.7-V to 3.6-V V_{CC} operation.

The SN74LVC14 contains six independent inverters. The device performs the Boolean function $Y = \overline{A}$.

Inputs can be driven from either 3.3-V or 5-V devices. This feature allows the use of these devices as translators in a mixed 3.3-V/5-V system environment.

The SN74LVC14 is characterized for operation from -40°C to 85°C.

Maximum power dissipation at T _A = 55°C (in still air) (see Note 3):	D package 1.25 W
	DB or PW package 0.5 W
Storage temperature range, T _{stg}	-65°C to 150°C

[†] Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
 - 2. This value is limited to 4.6 V maximum.
 - The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 750 mils.

 Data Book. literature number SCBD002B.
