## description

This quadruple bus buffer gate is designed for 2.7-V to 3.6-V V<sub>CC</sub> operation.

The SN74LVC126 features independent line drivers with 3-state outputs. Each output is disabled when the associated output-enable (OE) input is low.

To ensure the high-impedance state during power up or power down, OE should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

Inputs can be driven from either 3.3-V or 5-V devices. This feature allows the use of these devices as translators in a mixed 3.3-V/5-V system environment.

The SN74LVC126 is characterized for operation from -40°C to 85°C.

Maximum power dissipation at $T_A = 55^\circ\text{C}$ (in still air) (see Note 3): D package	.....	1.25 W
DB or PW package	.....	0.5 W
Storage temperature range, $T_{stg}$	.....	-65°C to 150°C

‡ Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES:
1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
  2. This value is limited to 4.6 V maximum.
  3. The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 750 mils. For more information, refer to the *Package Thermal Considerations* application note in the 1994 ABT Advanced BiCMOS Technology Data Book, literature number SCBD002B.
