

FEATURES

- Function and pinout compatible with the FCT and F Logic
- 25Ω Output series resistors to reduce transmission line reflection noise
- FCT-C speed at 4.1ns max. (Com'l), FCT2244T FCT-A speed at 4.8ns max. (Com'l)
- TTL output level versions of equivalent FCT functions
- Edge-rate control circuitry for significantly improved noise characteristics
- Power-off disable feature
- Fully compatible with TTL input and output logic levels
- 12mA Sink Current (Commercial), 12mA (Mil) 15mA Source Current (Commercial), 12mA (Mil)
- 3-State Outputs

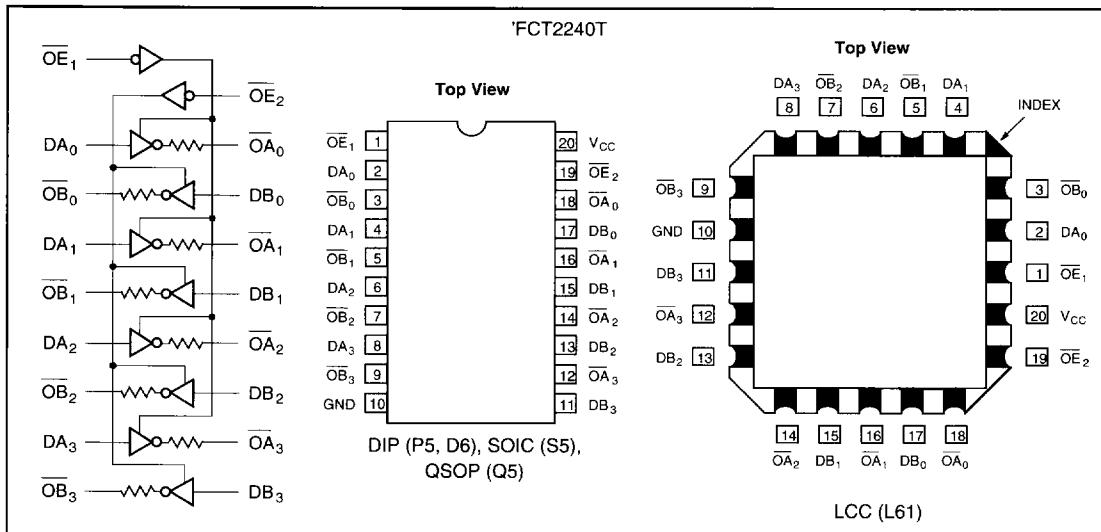

DESCRIPTION

'FCT2240T and 'FCT2244T are octal buffers and line drivers that include on-chip 25Ω terminating resistors at each of the outputs, to minimize noise resulting from reflections or standing waves in high-performance applications. The on-chip resistors reduce overall board space and component count.

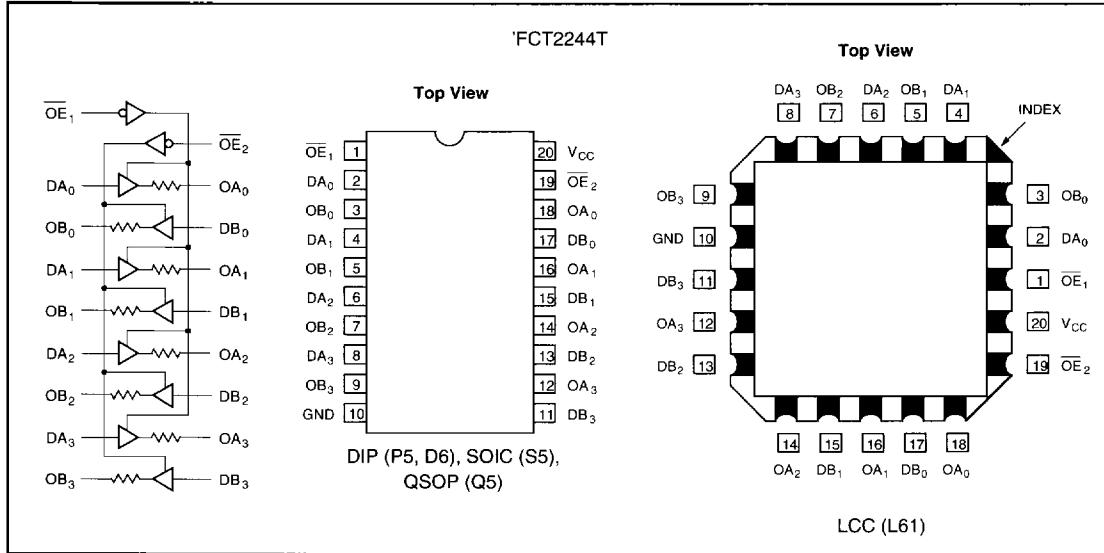

Designed to be employed as memory address drivers,

clock drivers, and bus-oriented transmitters/receivers, the devices provide speed and drive capabilities commensurate with their fastest bipolar logic counterparts while reducing overall power dissipation. The input and output voltage levels allow direct interface with TTL, NMOS and CMOS devices without the need for external components.

Notes:

1. Operation beyond the limits set forth in the above table may impair the useful life of the device. Unless otherwise noted, these limits are over the operating free-air temperature range.
2. Unused inputs must always be connected to an appropriate logic voltage level, preferably either V_{CC} or ground.
3. Typical values are at $V_{CC} = 5.0\text{V}$, $T_A = +25^\circ\text{C}$ ambient.
4. Not more than one output should be shorted at a time. Short should not exceed one second. To minimize internal chip heating and more

accurately reflect operational values, use of high-speed test apparatus and/or sample and hold techniques are preferable. Otherwise prolonged shorting of a high output may raise chip temperature well above normal causing invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

5. This parameter is guaranteed but not tested.
