### Description

The CD74FCT151T, CD74FCT251T, and CD74FCT2151T are high-speed 8-input multiplexers. They select one bit from a source of eight under the control of three select inputs. Both assertion and negation outputs are provided.

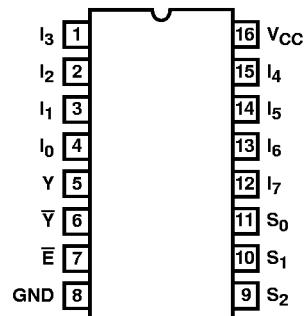

The CD74FCT151T, CD74FCT2151T have a common, active-LOW, Enable input ( $\bar{E}$ ). When  $\bar{E}$  is LOW, data from one of eight inputs is directed to the complementary outputs based on the 3-bit code applied to the Select ( $S_0-S_2$ ) inputs. The CD74FCT151T, CD74FCT2151T can be used as a data routing device from one of eight sources.

The CD74FCT251T has a common Active-LOW Output Enable ( $\bar{OE}$ ) input. When  $\bar{OE}$  is LOW, data from one of eight inputs is directed to the complementary outputs. When  $\bar{OE}$  is HIGH, both outputs are switched to a high-impedance state allowing multiplexer expansion by tying several outputs together.

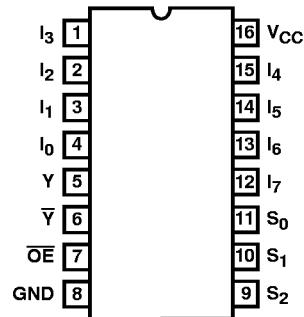

The CD74FCT2151T device has a built-in 25Ω series resistor on all outputs to reduce noise due to reflections, thus eliminating the need for an external terminating resistor.
