description

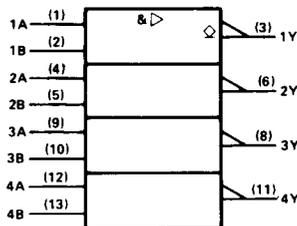

These devices contain four independent 2-input NAND buffers. They perform the Boolean functions $Y = A \cdot B$ or $Y = \overline{A} \cdot \overline{B}$ in positive logic. The open-collector outputs require pull-up resistors to perform correctly. They may be connected to other open-collector outputs to implement active-low wired-OR or active-high wired-AND functions. Open-collector devices are often used to generate higher V_{OH} levels.

The SN54ALS1003A is characterized for operation over the full military temperature range of -55°C to 125°C . The SN74ALS1003A is characterized for operation from 0°C to 70°C .
